

Making Cages

Preparation

- Set out how many cages you would need, depending on your food needs
- Fill each cage with 500-1000ml of the same water used to make subcultures.
- To each cage, add .05g powdered brewer's yeast tablets and 1/4tsp dry whole-wheat kernels that have been autoclaved.
- Each cage receives 30-50mls subculture. Be sure to stir the subculture before adding it to the cages because the paramecia will collect in pockets within the cage.
- Label the cages with the date and cover.
